MYDHL API INTEGRATION

Thank you for completing the MYDHL REST API onboarding process. Kindly pay attention to the following information required to complete the integration process seamlessly.

Attached is a JSON Collection export which contains basic sample requests for all necessary endpoints. The collection can be imported into either **Postman** or **Bruno**. See below tutorial on how to import JSON collections into Postman:
https://learning.postman.com/docs/getting-started/importing-and-exporting-data/

Below tutorial is on how to import to Bruno:
https://docs.usebruno.com/get-started/import-export-data/import-collections

The sample requests have been shortened to the major necessary parameters needed for each payload. **You are advised to only make changes to the dynamic variables and not fixed variables** in other not to return errors. Also attached is a document which contains necessary DHL checkpoint (tracking events) codes and descriptions for your perusal.

For an easy integration, we strongly suggest that you consume the API endpoints according to this process:
Address Validate => Rates => Shipment => Pickup => Tracking

Here is the base URL for the test endpoint:
https://express.api.dhl.com/mydhlapi/test

Add '/shipment', '/rates' etc. to the above base URL to test the API endpoint depending on the service you are requesting, e.g.
For rates: https://express.api.dhl.com/mydhlapi/test/rates
For shipments processing: https://express.api.dhl.com/mydhlapi/test/shipments

Below is a table that shows the usage of Account Numbers, Product Codes according to type of shipment either Domestic or International, Document or Non-Document.

	WITHIN GH	**GH - COUNTRY 1**	**COUNTRY 1 - GH**	**WITHIN COUNTRY 1**	**COUNTRY 1 - COUNTRY 2**
Account Type	EXP	EXP	IMP	IMP	IMP
Product Code (Document)	N	D	D	N	D
Product Code (Non-Document)	N	P	P	N	P

Your onboarding process through the developer portal gives you access to an analytics dashboard where you can query your usage of the API endpoints as used. To view your analytics dashboard,

- Log in to your Developer Dashboard.
- Click on your Application name.
- Click on the Analytics tab.

SHIPMENT PREPARATION:

Kindly take note of the following information when working specifically with the **Shipment API**.

- The table above shows when to use product codes appropriately. The three main product codes are:
  - N – all shipments processed within the same country
  - D – all documents processed between two countries
  - P – all non-documents (packages) prepared between two countries.

  (Note that the usage of these product codes is not limited only to the Shipment API. It cuts across all our API endpoints.)

- Under "pickup" object, "isRequested" should always be **false**. This is because there is a standalone Pickup API endpoint used for that purpose.
- Waybills/labels/paperwork are generated from the shipments API endpoint. The number of pages for labels/paperwork depends on the type of shipment to process. Please see below.
- For domestic shipments,
  - "imageOptions" under "outputImageProperties" must have two (2) templates,
  - "isCustomsDeclarable" is always **false**,
- For international non-documents (packages),
  - "imageOptions" under "outputImageProperties" must have three (3) templates which includes the Commercial Invoice (CIN),
  - "isCustomsDeclarable" is **true**,
  - Introduction of "exportDeclaration" under "content".
- The number of templates for each shipment type determines the number of pages for labels/waybills of each shipment.

GOOD LINE-ITEM DESCRIPTION & COMMODITY / HS CODES:

When preparing international non-documents (packages), the "lineItems" object is introduced under "exportDeclaration". This contains the information of each line item (item/product) in your package. Each item is expected to have an extensive description of what the item is. For example, "Shoes" will be termed as a **bad line-item description** as customs is expecting a more descriptive information such as "Pair of black leather shoes for adult male made in Nigeria".

In addition, it is expected that each line item must contain the **Commodity (HS) code**. This is mandatory to avoid shipment damage and/or other defects when shipments arrive at the customs office of the receiving country for inspection. Please note that **the Commodity (HS) code is not provided by DHL**, rather, European Customs. Hence, we are not able to help on generating these codes for the items.

You can check the European Customs portal using the link below for more information on HS codes.
